. Description of the Project	
A study and evaluation of commercially available signal fluid thirty minute burning time for air observation at night under ous conditions.	
Purpose of the Project	
A dispatch from the field has requested information regard commercially available DZ markers. As a preliminary step a stud- evaluation of railroad signal flares, both red and yellow, of 30 ate burning duration will be tested.	y and
Initially, samples of flares will be purchased from various afacturers and tested under ambient conditions. A notation will made of ease of ignition and burning time. Further samples will be purchased on the basis of this initial investigation.	be
The new samples will then be subjected to either hot or conscaling conditions for a period of five days. These temperature see 110°F and -20°F. After this five day period the samples will nediately be taken out and tested under the same general conditions the original samples.	s will im-
The last group of samples will be tested at night and view	rs, empt
from the air. The relative visibility from the air of both colors different heights and directions, will be determined. An attail be made to increase the visibility from the air and decrease is ibility from ground observation.	
From the air. The relative visibility from the air of both colors different heights and directions, will be determined. An attail be made to increase the visibility from the air and decreases

4. Support Requirements

There are no support requirements.

5. Total Cost

The estimated total cost of the work is \$3,452.00, including fixed fee. A six months working period will be used in this study. Charges are to be made against Allotment Number 0525-1009-4901.
